

# T-SPOT

## Satellite Tracker

**Simple, convenient and effective satellite communication**

40% of Australia is un-inhabited. There are many occasions where operating staff may be working or driving in these remote areas, handling hazardous goods or working alone where a call for help may not be readily available or where there is no mobile phone coverage. This makes satellite the only means of communication.

The T-SPOT is a GPS-enabled personal satellite tracking, messaging and emergency communications device providing a simple way to help address remote driver safety. Using 100% satellite technology, the T-SPOT works virtually anywhere in the world, even where there is no mobile network coverage.

To assist drivers in remote or dangerous situations, this small hand-held device provides a satellite communications system that is easy to use. The T-SPOT is rugged and portable and is the one item a driver shouldn't be without in-case of duress or man-down; the built-in panic alarm notifies the back-office.

T-SPOT features include "Track me for 24 hours" or "Check-in". This provides the home base assurance that the worker is safe and OK. Should the driver not check-in, the home base can raise an alarm and send out help immediately. Similarly if the worker were to press the "SOS" button, an alert to the back-office notifies that a critical situation has occurred and allows for rescue or other help to be sent out immediately.

All of this utilises the same NextGen tracking and event management process that the transport operator uses to monitor their vehicles. One central point of control for all out of office activity that needs to be managed and monitored.

### T-SPOT provides peace of mind to workers and employers:

- Helps operators comply with legislative requirements for worker safety where regulated.
- Helps address check-in requirements.
- Sends GPS location coordinates of lone drivers and/or teams.
- Provides multiple messaging options for operators.
- An affordable GPS-enabled personal satellite messaging and emergency communications device
- Tracks staff in real-time.
- 100% satellite technology so it works where there's no mobile coverage.

### ✔ Features and Benefits

- ✔ **Alert SOS:** Notifies back-office of their GPS location in case of life threatening events or critical emergencies.
- ✔ **Help:** A pre-programmed request sent to head office.
- ✔ **Check-in/OK:** Drivers can advise the depot or back office of their arrival at a location or specific intervals.
- ✔ **Custom Messages:** Pre-programmed messages providing flexibility in communication.
- ✔ **Tracking:** Ability to see the location beyond cellular networks.
